

Please amend claim 28 to the following (clean form):

28. (Once Amended) A computer-readable medium having at least one data structure from which a sound effect can be produced encoded thereon, said data structure comprising:

a first sound segment for initiating said sound effect;

a second sound segment which is repeatable to sustain said sound effect; and

a third sound segment for decaying said sound effect;

wherein said first sound segment, said second sound segment and said third sound segment are associated with a transition between display states of a graphical user interface.

Kindly add claims 29-36 as follows:

--29. A method for providing a sound effect corresponding to movement of an object drawn on a graphical user interface of a computer system, the method comprising steps of:

drawing said object in said first display position of a display space controlled by said graphical user interface;

receiving a first indication of movement of said object, the movement being on said graphical user interface;

retrieving a sustain sound segment in response to said first indication;

producing said sustain sound segment;

terminating said sustain sound segment in response to said second indication.

repeatedly reproducing said sustain sound segment until said second indication is received.

31. The method of claim 29, further comprising a step of:

- panning said sustain sound segment between speakers as said object moves.

varying a volume between said speakers as compared to a recorded volume.

reproducing said sustain sound segment at a volume specified for movement of said object.

38. The method of claim 30, further comprising a step of:  
selecting, from within a range of frequencies, a frequency for repeatedly reproducing said sustain sound segment.

39. The method of claim 38, wherein said step of selecting further comprises a step of:

setting said range of frequencies to an envelope of about plus or minus 2.5 percent of an original frequency at which said sustain sound segment was recorded.

40. The method of claim 39, wherein said step of selecting a frequency further comprises a step of:

weighting selection of said frequency from within said envelope.

41. A computer system with a display and a sound effect system, said computer system comprising:

an input device for controlling movement of a cursor on said display, wherein said input device generates a cursor output in response to said cursor being positioned over said control element;

a graphical user interface for rendering said object on said display at a first display position;

a speaker for producing a sound effect associated with movement of said object;

a storage device for storing said sound effect; and

a processor for controlling the speaker to produce said sound effect in response to movement of the object from the first display position.

CL. 14

second speaker in response to movement of the object.

speaker as compared to a recorded volume.

45. The computer system of claim 41, wherein a data structure associated with said sound effect includes a pitch parameter specified for output of said sound effect.

46. The computer system of claim 41, wherein a data structure associated with said sound effect includes a volume gain parameter specified for output of said sound effect.

47. The computer system of claim 41, wherein a data structure associated with said sound effect includes an attack segment, a sustain segment and a decay segment.

48. The computer system of claim 47, further comprising:  
means for retrieving, prior to retrieving said sustain sound segment, said attack sound segment; and  
wherein said attack sound segment is reproduced prior to repeatedly reproducing said sustain sound segment.

49. The computer system of claim 48, wherein said means for retrieving further comprises:  
means for retrieving and reproducing, after said second display position is reached, said decay sound segment.

50. The computer system of claim 41, further comprising:  
means for selecting, from within a range of frequencies, a frequency for repeatedly reproducing said sound effect.

51. The computer system of claim 48, wherein said means for selecting further comprises:  
means for setting said range of frequencies to an envelope of about plus or minus 2.5 percent of an original frequency at which said sound effect was recorded.

52. The computer system of claim 51, wherein said means for selecting further comprises:  
  
means for weighting a selection of said frequency from within said envelope.

53. In a graphical user interface, a method for providing sound effects comprising the steps of:  
  
displaying an object in a first display state;  
  
identifying a sound effect using a state table, said sound effect being associated with a transition from a first display state to a second display state;  
  
varying an output characteristic of said sound effect; and  
  
reproducing said sound effect using said varied output characteristic.

54. The method of claim 53, wherein said output characteristic is frequency.

55. The method of claim 54, wherein said frequency is selected from within an envelope of about plus or minus 2.5 percent of an original, recorded frequency.

56. The method of claim 55, wherein said selection is weighted toward said original, recorded frequency.--
